The statistical analysis employed to find out the exact position of the straight line is known as Linear regression analysis. From simple correlation analysis if there exist relationship between independent variable x and dependent variable y then the relationship can be expressed in a mathematical form known as Regression equation.

Correlation and Linear Regression Analysis | Biostatistics

The technique that specifies the dependence of the response variable on the explanatory variable is called regression. When that dependence is linear (which is the case in our examples in this section), the technique is called linear regression.

A linear regression involves one independent variable and the outcome variable. This should be used to model a relationship between data if the dependent variable is continuous and approximately normal. A multiple regression involves two or more independent variables that are expected to influence the outcome variable.
